

CONVOLUTION AND APPROXIMATE IDENTITIES

SIMON GRÜNING

2. EXAMPLES OF TOPOLOGICAL GROUPS

DEFINITION 2.1. *Topological Group*

DEFINITION 2.2. *Locally Compact*

DEFINITION 2.3. *Haar Measure*

EXAMPLE 2.1. $\mathbb{R}^n, \mathbb{Z}^n, \mathbb{T}^n$

EXAMPLE 2.2. $dx/|x|$

EXAMPLE 2.3. *Heisenberg Group* \mathbb{H}^n

3. CONVOLUTION

DEFINITION 3.1. Let $f, g \in L^1(G)$. Define the **convolution** $f * g$ by

$$(f * g)(x) := \int_G f(y)g(y^{-1}x)d\lambda(y) \quad (1)$$

REMARK 3.1. Note that on \mathbb{R}^n with an additive structure (our preferred environment for later chapters), we will simply have:

$$(f * g)(x) = \int_{\mathbb{R}^n} f(y)g(x - y)dy$$

EXAMPLE 3.1. Let $G = \mathbb{R}$,

$$f(x) = \begin{cases} 1 & -1 \leq x \leq 1 \\ 0 & \text{else} \end{cases} \quad (2)$$

Then we calculate:

$$\begin{aligned} (f * f)(x) &= \int_{\mathbb{R}} f(y)f(x - y)d\lambda(y) \\ &= \begin{cases} \int_{\mathbb{R}} 0d\lambda(y) & -1 \leq x \leq 1 \\ \int_{\mathbb{R}} \chi_{[-1,1] \cap [x-1,x+1]}(x)d\lambda(x) & \text{else} \end{cases} \end{aligned}$$

Notice that the convolution operator has a natural smoothing effect on f , as it does on every function.

LEMMA 3.1. *Convolution is defined λ almost everywhere.*

Proof. To see this we take the L_1 norm on the definition to find it finite:

$$\begin{aligned}
 \|(f * g)(x)\|_{L^1} &= \int_G \left| \int_G f(y)g(y^{-1}x)d\lambda(y) \right| d\lambda(x) && \text{(Apply Norm)} \\
 &\leq \int_G \int_G |f(y)| |g(y^{-1}x)| d\lambda(y)d\lambda(x) && \text{(Tri. Ineq.)} \\
 &= \int_G \int_G |f(y)| |g(y^{-1}x)| d\lambda(x)d\lambda(y) && \text{(Fubini)} \\
 &= \int_G |f(y)| \int_G |g(y^{-1}x)| d\lambda(x)d\lambda(y) && \text{(Measure-Invariance)} \\
 &= \int_G |f(y)| \int_G |g(x)| d\lambda(x)d\lambda(y) && \text{(Left Haar)} \\
 &= \|f\|_{L^1} \|g\|_{L^1} && \text{(Def.)} \\
 &< \infty && \text{(Def.)}
 \end{aligned}$$

□

LEMMA 3.2.

$$(f * g)(x) = \int_G f(xz)g(z^{-1})d\lambda(z)$$

Proof. We perform a change of variables $z = x^{-1}y$:

$$\begin{aligned}
 (f * g)(x) &= \int_G f(y)g(y^{-1}x)d\lambda(y) \\
 &= \int_G f(xx^{-1}y)g((yx^{-1})^{-1})d\lambda(y) \\
 &= \int_G f(xz)g(z^{-1})d\lambda(x^{-1}y) && \text{(Left Invariance)} \\
 &= \int_G f(xz)g(z^{-1})d\lambda(z)
 \end{aligned}$$

□

PROPOSITION 3.1. $\forall f, g, h \in L^1(G)$:

- (1) $f * (g * h) = (f * g) * h$
- (2) $f * (g + h) = f * g + f * h$ \wedge $(f + g) * h = f * h + g * h$

Thus convolution is associative and distributive.

Proof. Associativity:

ZZZZZZZZZZZZ

Distributivity:

$$\begin{aligned}
 f * (g + h) &= \int_G f(y)(g + h)(y^{-1}x) d\lambda(y) \\
 &= \int_G f(y)(g(y^{-1}x) + h(y^{-1}x)) d\lambda(y) \\
 &= \int_G f(y)g(y^{-1}x) + f(y)h(y^{-1}x) d\lambda(y) \\
 &= \int_G f(y)g(y^{-1}x) d\lambda(y) + \int_G f(y)h(y^{-1}x) d\lambda(y) \\
 &= f * g + f * h
 \end{aligned}$$

The mirror statement follows analogously. \square

REMARK 3.2. *Proof.* Notice the following trivial equality:

$$\begin{aligned}
 \|f\|_{L^p}^{p/q} &= ((\int_G |f(x)|^p d\lambda(x))^{1/p})^{p/q} \\
 &= (\int_G |f(x)|^p d\lambda(x))^{1/q}
 \end{aligned}$$

\square

4. BASIC CONVOLUTION INEQUALITIES

DEFINITION 4.1. Define $p' := p/(p - 1)$. To maintain our desired property in infinity we also declare: $1/\infty = 0$

REMARK 4.1. Notice then: $\frac{1}{p} + \frac{1}{p'} = \frac{1}{p} + \frac{p-1}{p} = \frac{p}{p} = 1$

REMARK 4.2. In the following proofs we often make use of this useful inequality without further explication, it allows us to manipulate inequalities without worrying about negatives:

$$\begin{aligned}
 f * g &= \int_G f(y)g(y^{-1}x) d\lambda(y) \\
 &\leq \left| \int_G f(y)g(y^{-1}x) d\lambda(y) \right| \\
 &\leq \int_G |f(y)| |g(y^{-1}x)| d\lambda(y) \\
 &= |f| * |g|
 \end{aligned}$$

What follows is akin to the triangle inequality for L^p spaces.

THEOREM 4.1. *Minkowskis Inequality:* Let $1 \leq p \leq \infty$, $f \in L^p(G)$, $g \in L^1(G)$ then it follows that: $g * f$ exists λ -almost-everywhere and $\|g * f\|_{L^p(G)} \leq \|g\|_{L^1(G)} \|f\|_{L^p(G)}$

Proof. First we shall inspect the easier case of $p = 1$: ZZZZZZproofZZZZ

Similarly we may rid ourselves of the other easy case $p = \infty$: ZZZZproofZZZZ

For $1 < p < \infty$, we must work a little harder. We have:

$$(|g| * |f|)(x) = \int_G |f(y^{-1}x)| |g(y)| d\lambda(y)$$

We shall apply H lders inequality as follows ZZZ to recieve:

$$(|g| * |f|)(x) \leq \left(\int_G |f(y^{-1}x)|^p |g(y)| d\lambda(y) \right)^{1/p} \left(\int_G |g(y)| d\lambda(y) \right)^{1/p'}$$

Since we are insane ZZZZ we may take the L^p norm on both sides while preserving the inequality.

$$\begin{aligned} \| |g| * |f| \|_{L^p} &= () \\ &= blah \end{aligned}$$

THEOREM 4.2. *Youngs Inequality*

THEOREM 4.3. *Youngs Inequality for Weak Type Spaces ouch proof*

5. APPROXIMATE IDENTITIES

Approximation of dirac delta function , identity element of convolutions

DEFINITION 5.1. An **approximate identity** (as $\varepsilon \rightarrow 0$) is a family of $L^1(G)$ functions k_ε with the following three properties:

- (i) There exists a constant $c > 0$ such that $\|k_\varepsilon\|_{L^1(G)} \leq c$ for all $\varepsilon > 0$.
- (ii) $\int_G k_\varepsilon(x) d\lambda(x) = 1$ for all $\varepsilon > 0$.
- (iii) For any neighborhood V of the identity element e of the group G we have $\int_{V^c} |k_\varepsilon(x)| d\lambda(x) \rightarrow 0$ as $\varepsilon \rightarrow 0$.

THEOREM 5.1. Any approximate identity has the following two properties:

- (1) $f \in L^p(G) \wedge 1 \leq p < \infty \implies \|k_\varepsilon * f - f\|_{L^p(G)} \rightarrow 0$ as $\varepsilon \rightarrow 0$
 - (2) $f \in L^\infty(G)$ uniformly continuous on $K \subset G \implies \|k_\varepsilon * f - f\|_{L^\infty(K)} \rightarrow 0$ as $\varepsilon \rightarrow 0$
- Furthermore, if f is bounded and continuous at $x \in G$ then $(k_\varepsilon * f)(x) \rightarrow f(x)$ as $\varepsilon \rightarrow 0$

Proof. Let us first prove the statement in finite L^p spaces. We shall make use of the following equality:

$$\begin{aligned} \forall p \in \mathbb{N} : \left| g(h^{-1}x) - g(x) \right|^p &\leq \left(|g(h^{-1}x)| + |g(x)| \right)^p \\ &\leq \left(\operatorname{ess. sup}_x |g(h^{-1}x)| + \operatorname{ess. sup}_x |g(x)| \right)^p \\ &\leq (2\|g\|_{L^\infty})^p \end{aligned}$$

Applying the Lebesgue Dominated Convergence theorem (*) we find:

$$\int_G |g(h^{-1}x) - g(x)|^p d\lambda(x) \rightarrow 0 \text{ as } h \rightarrow e$$

Where e is the neutral element of G . In \mathbb{R}^n this is simply 0. We can approximate any $g \in L^p(G)$ with a continuous function f with compact support. Thus the property still holds:

$$\int_G |f(h^{-1}x) - f(x)|^p d\lambda(x) \rightarrow 0 \text{ as } h \rightarrow e$$

However we can now say that since f is continuous,

$$\delta > 0 : \exists V(e) : h \in V(e) \implies \int_G |f(h^{-1}x) - f(x)|^p d\lambda(x) < \left(\frac{\delta}{2}\right)^p \left(\frac{1}{c}\right) \quad (3)$$

Where $c*$, $V(e)$ is a neighborhood of e . We shall fix this neighborhood for later. We have picked the value on the right side for later convenience. As with most proofs in this area, we shall split the object of our analysis into two parts we can evaluate:

$$(k_\epsilon * f)(x) - f(x) = \int_G (f(y^{-1}x) - f(x))k_\epsilon(y)d\lambda(y)$$

We take L^p norms on both sides. This preserves the equality since *.

$$\begin{aligned} \|(k_\epsilon * f)(x) - f(x)\|_{L^p(G)} &= \left\| \int_G (f(y^{-1}x) - f(x))k_\epsilon(y)d\lambda(y) \right\|_{L^p(G)} \\ &= \left(\int_G \left| \int_G (f(y^{-1}x) - f(x))k_\epsilon(y)d\lambda(y) \right|^p d\lambda(x) \right)^{\frac{1}{p}} \\ &\leq \left(\int_G \int_G |f(y^{-1}x) - f(x)|^p |k_\epsilon(y)| d\lambda(y)d\lambda(x) \right)^{\frac{1}{p}} \\ &= \left(\int_G \int_V |f(y^{-1}x) - f(x)|^p |k_\epsilon(y)| d\lambda(y)d\lambda(x) + \int_G \int_{V^c} |f(y^{-1}x) - f(x)|^p |k_\epsilon(y)| d\lambda(y)d\lambda(x) \right)^{\frac{1}{p}} \end{aligned}$$

Where the inequality originates from Jensen's inequality *. Notice that we can now inspect on V and V^c , we shall call the respective parts of the function F_V and F_{V^c} such that our last statement can be rewritten as $(F_V + F_{V^c})^{\frac{1}{p}}$ for convenience. We now look at them individually.

$$\begin{aligned} F_V &= \int_G \int_V |f(y^{-1}x) - f(x)|^p |k_\epsilon(y)| d\lambda(y)d\lambda(x) \\ &= \int_V \int_G |f(y^{-1}x) - f(x)|^p |k_\epsilon(y)| d\lambda(x)d\lambda(y) \\ &= \int_V \int_G |f(y^{-1}x) - f(x)|^p d\lambda(x) |k_\epsilon(y)| d\lambda(y) \\ &\leq \int_V \left(\left(\frac{\delta}{2c}\right)^p \frac{1}{c} \right) |k_\epsilon(y)| d\lambda(y) \end{aligned}$$

$$\begin{aligned}
 &= \left(\left(\frac{\delta}{2c}\right)^p \frac{1}{c}\right) \int_V |k_e(y)| d\lambda(y) \\
 &\leq \left(\left(\frac{\delta}{2c}\right)^p \frac{1}{c}\right) \int_G |k_e(y)| d\lambda(y) \\
 &\leq \left(\left(\frac{\delta}{2c}\right)^p \frac{1}{c}\right) c \\
 &= \left(\left(\frac{\delta}{2c}\right)^p\right)
 \end{aligned}$$

Here we have used Fubini *, substituted our previously discovered upper bound, and used property (i) intrinsic of any approximate identity, as defined. We bound the other half now:

$$\begin{aligned}
 F_{V^p} &= \int_G \int_{V^c} |f(y^{-1}x) - f(x)|^p |k_\epsilon(y)| d\lambda(y) d\lambda(x) \\
 &= \int_{V^c} \int_G |f(y^{-1}x) - f(x)|^p |k_\epsilon(y)| d\lambda(x) d\lambda(y) \\
 &= \int_{V^c} \left\| f(y^{-1}x) - f(x) \right\|_{L^p}^p |k_\epsilon(y)| d\lambda(y)
 \end{aligned}$$

□

EXAMPLE 5.1. A useful example of an approximate identity is the poison kernel on \mathbb{R} , defined as:

$$\begin{aligned}
 P(x) &:= (\pi(x^2 + 1))^{-1} \\
 P_\epsilon(x) &:= \epsilon^{-1} P(\epsilon^{-1}x)
 \end{aligned}$$

Notice first a convenience:

$$\begin{aligned}
 \|P(x)\|_{L^1} &= \int_{\mathbb{R}} \frac{1}{\epsilon \pi(\frac{x^2}{\epsilon^2} + 1)} \epsilon d\lambda(y) \\
 &ZZZZ
 \end{aligned}$$

From this it follows that
